

## Purpose

In this lab activity, you will measure the loss of mass of a reactant at several times during a chemical reaction. Using the previous graph of the data, you will calculate the average and instantaneous rates of reaction.

The reaction involved is

You will measure the loss of mass in this reaction as the carbon dioxide is released

**Caution:**

HCl is an acid. Gloves, goggles, and clothing protection must be worn.

## Procedure

1. Place 10 to 12 large pieces of  $\text{CaCO}_3$  into a paper cup or on filter paper on a scale. Pour 100 mL of 3.0 mol/L HCl solution into a 500 mL beaker. Place the beaker on the scale beside the  $\text{CaCO}_3$ . Record the total mass of everything.
2. With a stopwatch ready and the beaker on the scale, the person timing the lab activity should indicate when to pour the  $\text{CaCO}_3$  chips into the acid and start the timer. Be sure to put the cup or filter paper back on the scale—it must remain there until the end of the experiment.
3. Record the mass every 30 seconds for 20 minutes.

## Questions

1. The loss in mass in this reaction equals the amount of  $\text{CO}_2$  produced. Calculate the mass of  $\text{CO}_2$  produced for each 30-second time interval.
2. Calculate the average reaction rate. Using the average rate of reaction formula (provided at the start of this lab activity), determine the average rate of this reaction for the following time intervals:
  - a) First 5 minutes
  - b) First 10 minutes
  - c) Last 5 minutes
  - d) Last 10 minutes
  - e) From 5 to 15 minutes
  - f) For the entire 20 minutes
3. Construct a graph of mass of  $\text{CO}_2$  produced versus time.

4. Calculate the instantaneous rate of reaction. On your graph, mark the point, draw an approximate tangent line, and calculate the slope of the tangent for the following instants of time:
  - a) 30 seconds
  - b) 60 seconds
  - c) 5 minutes
  - d) 10 minutes
  - e) 15 minutes
  - f) 20 minutes
5. What did you observe in the rate of this reaction from beginning to end? Why does the reaction rate change over time?
6. Explain when it would be useful to know the average rate of reaction and when you would need to know the instantaneous rate of reaction.
